4.50 dialog – Graphic . . . . .	64

# Preface

The wish to enhance application of the *model-based method* motivated the creation of the UML-editor .

In this sense the editor is unique, since it permits the modeling of UML/INTERLIS, i.e. the synthesis of two standards within the scope of data-modeling.

INTERLIS is a specific form of UML which permits the automatic derivation of different formats (amongst others the XML-Schema).

This tool is an attempt to facilitate the application and thus the mastery of the very complex matter of UML and INTERLIS thanks to a intuitive device and hence to render it accessible to a greater number of users.

Thus we express due thanks to KOGIS because without their support this UML/INTERLIS-editor could never have been achieved.

# Chapter 1

## Regarding This Document

- Chapter [2](#) gives general information concerning the UML-editor.
- Chapter [3](#) describes function and interface of the UML-editor.
- Chapter [4](#) describes specific model elements (objects) of the UML-editor.

# Chapter 2

## General Remarks

This reference manual has been conceived as an accompanying document for the UML-editor. Thus it offers assistance in the use of functions and explain procedures of the tool. At the same time it displays the technical possibilities of the editor in the modeling of UML and INTERLIS.

Modeling with the UML-editor requires a certain knowledge in UML (see chapter B) [1] and INTERLIS (see chapter C.1). Therefore we do not enter into these topics, because they would be beyond the scope of this reference manual. You will find further information concerning UML in the Internet and for INTERLIS there is an *INTERLIS Reference Manual*[6] which offers ample explication concerning the use of INTERLIS by means of practical examples.

In addition to this manual there is also an *Introduction to the UML/INTERLIS-editor* [7] with a step-by-step explanation of modeling with the UML-editor.

### 2.1 Installation

For further instructions concerning the installation of the UML-editor see [7].

## 2.5 Software applied

- Java SDK (cf. <http://java.sun.com>)
- JHotDraw (Graphic) (cf. <http://sourceforge.net/projects/jhotdraw>)
- Apache Software Foundation (XML) (cf. <http://www.apache.org>)

# Chapter 3

## User Interface

On principle the UML-editor see fig. 3.1 represents the most important model elements (see chapter 4) hierarchically in the navigation pane as a tree-structure (see chapter 3.3). Some few elements (e.g. generalization, dependencies, syntax, etc.) do not really make sense in the navigation pane and hence will be suppressed by the UML-editor . However these model elements can still be maintained via the specification dialogs (see chapter 4.2) .

A possible element in the navigation pane is the class diagram (see chapter 4.1), which permits *graphic modeling*. Thus it is possible to represent model elements from the navigation pane in a class diagram. The same model element may appear in several diagrams in order to further visualize different aspects of the same data model. However graphic representation is not possible for all model elements. Class diagrams can be generated in the navigation pane and then opened in the modeling space (see chapter 3.4) .

### 3.1 Menu Bar

The menu list contains the names of the menus. By clicking a menu name a list of commands will appear, which in turn control a series of functions of the UML-editor.

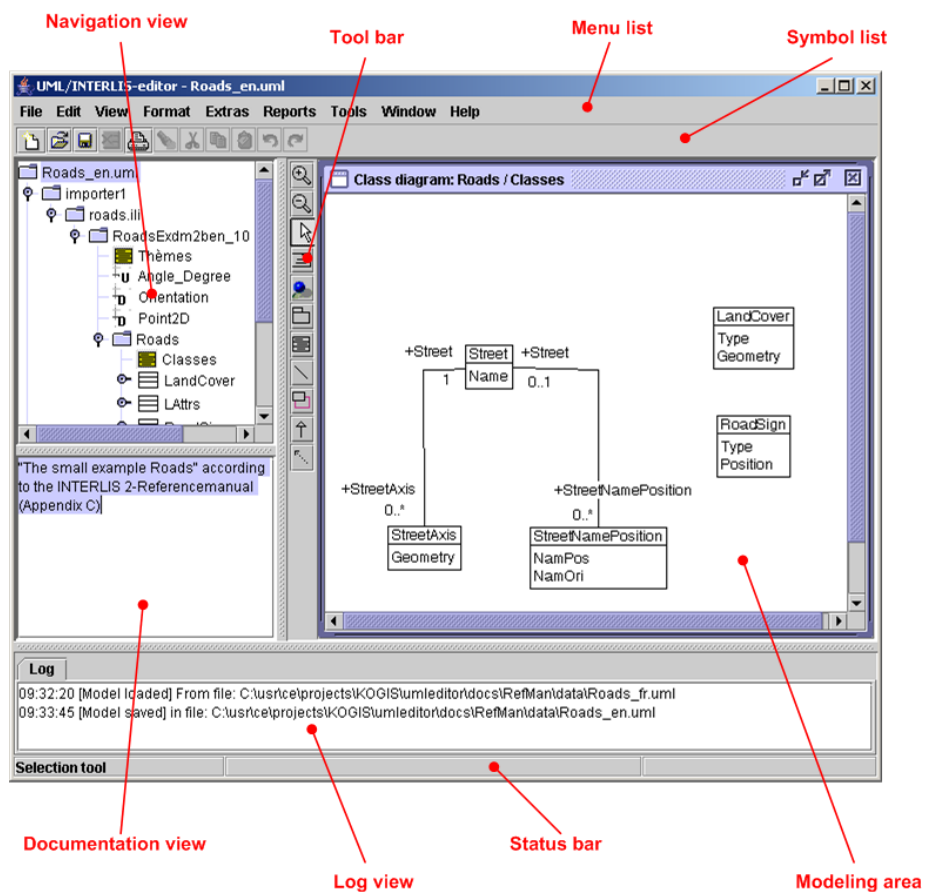

Figure 3.1: UML-editor with example-model ROADS

### 3.1.1 File

FUNCTION	DESCRIPTION
<i>New</i>	Generates a new model.
<i>Open...</i>	Opens a file dialog for the selection of a model file.
<i>Save</i>	Saves the present model with the file name indicated.
<i>Save as...</i>	Opens a file dialog for the saving of a file name with a different name.
<i>Print...</i>	Opens a print dialog.
<i>Close</i>	Closes the program.

### 3.1.2 Editing

FUNCTION	DESCRIPTION
<i>Undo</i>	(At present this function is not implemented.)
<i>Restore</i>	(At present this function is not implemented.)
<i>Cut</i>	(At present this function is not implemented.)
<i>Copy</i>	(At present this function is not implemented.)
<i>Insert</i>	(At present this function is not implemented.)
<i>Select all</i>	(At present this function is not implemented.)
<i>Search/Replace...</i>	Opens a search-dialog see fig. 3.2, to find elements that correspond to the search criteria. By selecting an element in the <i>search result list</i> the relevant element is automatically selected in the navigation pane .

### 3.1.3 View

FUNCTION	DESCRIPTION
<i>Look &amp; Feel</i>	Various representation managers can be selected (independent of platform).
<i>Symbol lists</i>	The standard tool bar (see chapter 3.2) can be activated/ deactivated.
<i>Status bar</i>	The status bar can be activated/ deactivated.

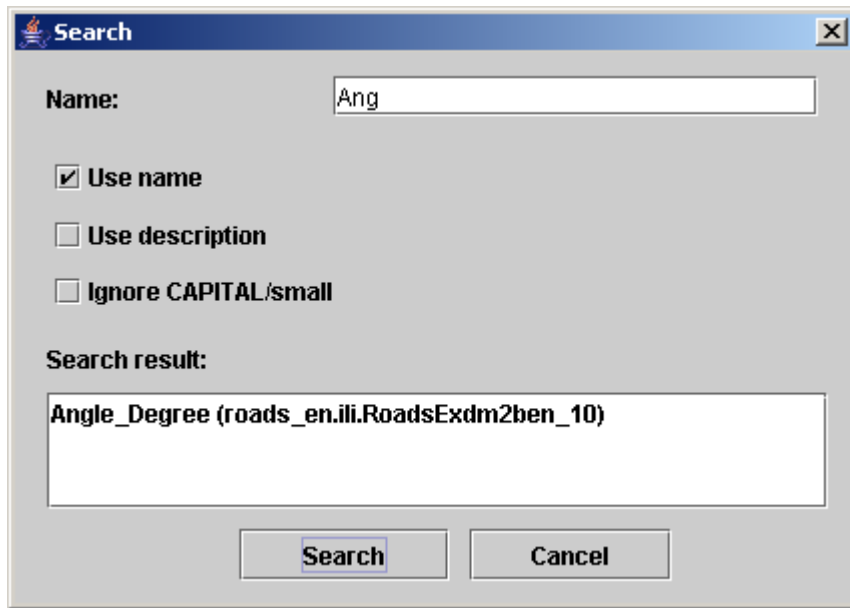

Figure 3.2: dialog – Search/Replace

### 3.1.4 Formatting

FUNCTION	DESCRIPTION
<i>Adjuste diagram</i>	The contents of the present diagram are automatically adjusted. The function attempts to distribute the model elements as evenly as possible in the diagram and at the same time to avoid as much as possible crossings of lines. In general when using this function it is necessary to manually improve this arrangement.

### 3.1.5 Extras

FUNCTION	DESCRIPTION
<i>Options...</i>	An options dialog see fig. 3.3, see fig. 3.4 is opened. The necessary configurations are stored in the file <i>.umleditor</i> in your personal directory ( $\${user.home}$ ).

FIELD	DESCRIPTION
<i>Work directory</i>	Standard directory for the saving and opening of files.
<i>Import directory</i>	Standard directory for the import of data.
FIELD	DESCRIPTION
<i>Width (Standard)</i>	Standard width for new class diagrams.
<i>Height (Standard)</i>	Standard height for new class diagrams.

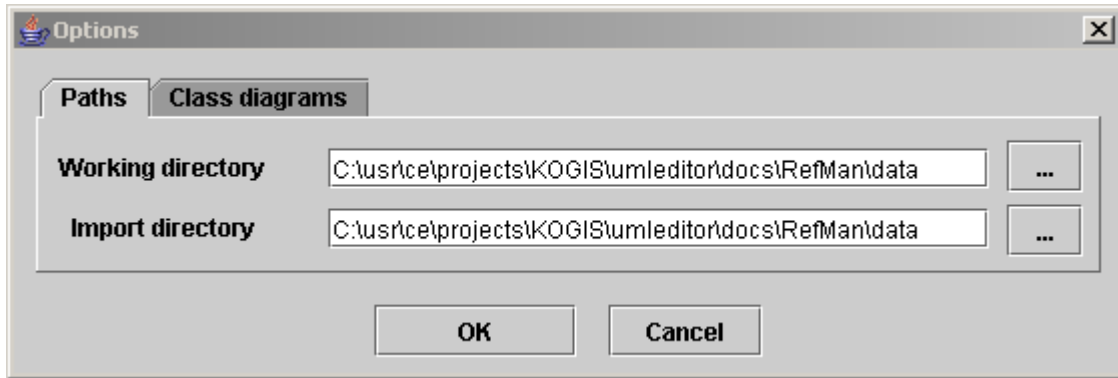

Figure 3.3: dialog – Options (tag *paths*)

Figure 3.4: dialog – Options (tag *Class diagrams*)

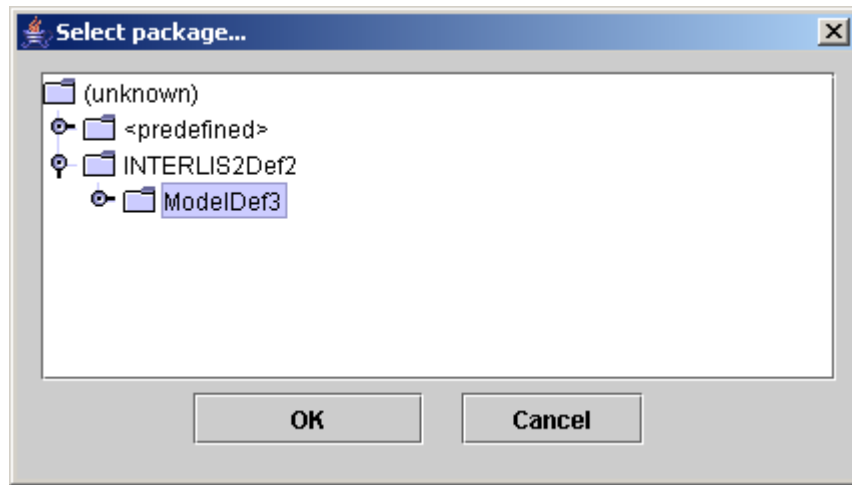

Figure 3.5: dialog – Package selection dialog

These values define the minimal size of a diagram and thus also the size of a new empty diagram. Depending on the size of your screen it may be sensible to alter these values. If some model elements are situated at the lower or right edge of a diagram, this diagram is automatically enlarged even without previously altering the corresponding values.

### 3.1.6 Reports

FUNCTION	DESCRIPTION
<i>Object catalog...</i>	Opens a package selection dialog see fig. 3.5 for the selection of a package. For the package thus selected, model objects are listed in an HTML-report see fig. 3.6.
<i>Structure...</i>	Opens a package selection dialog see fig. 3.5 for the selection of a package. For the package thus selected the corresponding package structure is generated in an HTML-report see fig. 3.7.

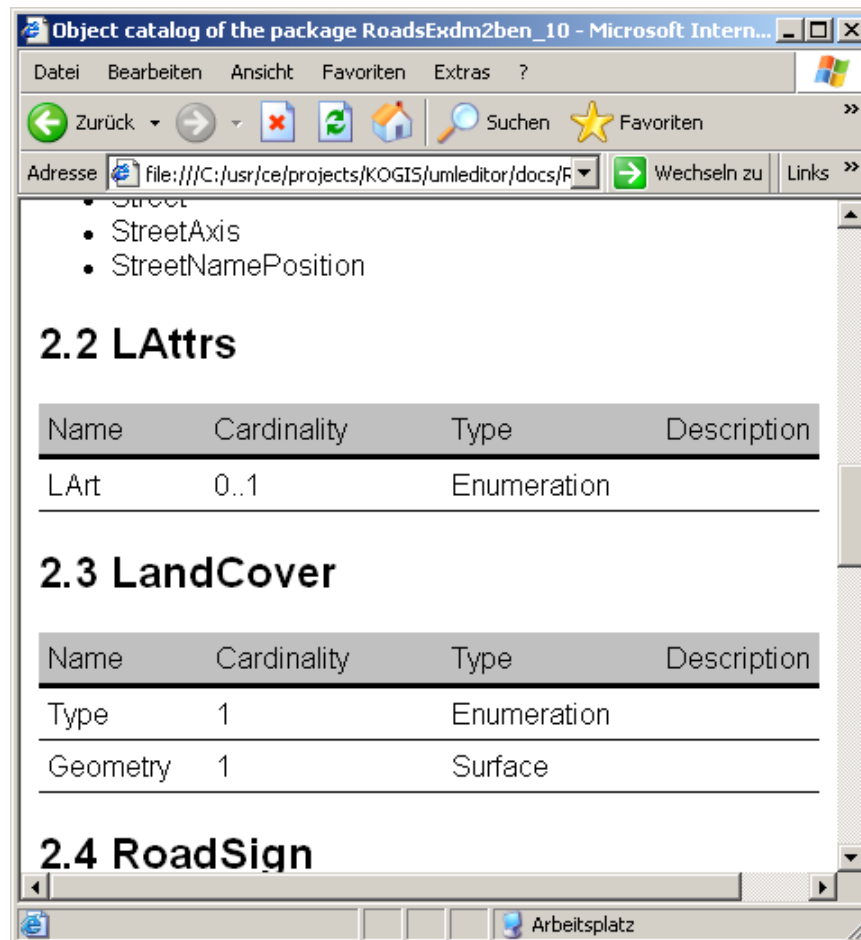

Figure 3.6: dialog – Report *object catalog*

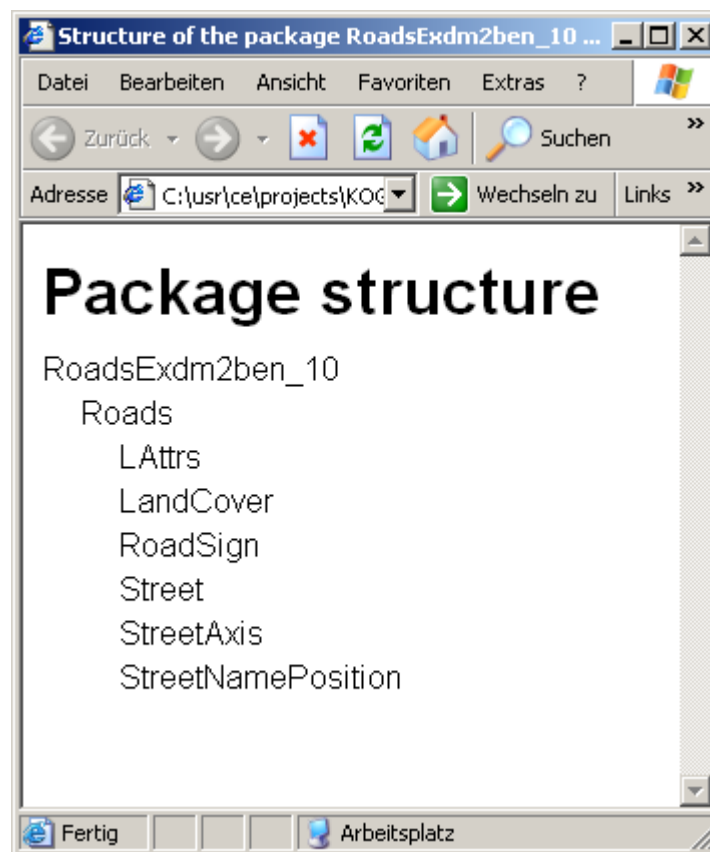

Figure 3.7: dialog – Report *structure*

### 3.1.7 Tools

#### INTERLIS

FUNCTION	DESCRIPTION
<i>Import...</i>	Opens a file dialog in order to import INTERLIS-model files into the model (see chapter <a href="#">D.4</a> ).
<i>Import groups...</i>	(At present this function is not implemented.)
<i>Export...</i>	Generates the INTERLIS-model files (see chapter <a href="#">D.4</a> ) according to the present model in the work directory (see chapter <a href="#">3.1.5</a> ).
<i>Export XML-Schema ...</i>	Opens a file-dialog for the export of the XML-Schema (XSD) (see chapter <a href="#">D.2</a> ). The XML-Schema thus generated describes the transfer format.
<i>Model check</i>	The model is examined by means of the INTERLIS compiler (see chapter <a href="#">C.2</a> ). Possible errors appear in the log pane with an identification number (see chapter <a href="#">3.6</a> ).

#### XMI/ROSE

FUNCTION	DESCRIPTION
<i>Import...</i>	Opens a file dialog to import a model file exported with Rational-Rose via XMI .

### 3.1.8 Window

FUNCTION	DESCRIPTION
<i>Cascade</i>	Several windows in the modeling space will be super-positioned one behind the other.
<i>Distribute</i>	Several windows in the modeling space will be super-positioned one below the other.

### 3.1.9 Help

FUNCTION	DESCRIPTION
<i>Help...</i>	Opens a help-line in a browser.
<i>Info...</i>	Opens an info dialog with information concerning the program.

## 3.2 Symbol Bar

Depending on the context, individual functions are activated or deactivated (by activating the symbols in the symbol list). By positioning the mouse cursor on a symbol, the corresponding description of the function appears in text form.

*New* (see chapter 3.1.1).

*Open...* (see chapter 3.1.1).

*Save* (see chapter 3.1.1).

*Print* (see chapter 3.1.1).

## 3.3 Navigation Pane

The navigation pane represents the entire model as a tree structure . Thus the user may see how the model is organized and the view can be adjusted to the current needs of the user by opening/closing sub-trees A context-sensitive menu will show the possible functions for each selected model element in the tree:

FUNCTION	DESCRIPTION
<i>New</i>	Permits the inserting of a new model element. Depending on the selection various elements are available (see chapter 4).
<i>Modify...</i>	Opens the specification dialog for the corresponding element model element (see chapter 4.2).
<i>Activate diagram</i>	Opens or displays the selected diagram in the foreground within the modeling range.
<i>Sort</i>	Arranges the tree structure according to the possible selection, criterias being <i>Name</i> or <i>Type/Name</i> .
<i>Print...</i>	Opens a print dialog.
<i>Delete (in the model)</i>	Deletes the selected model element from the model.
<i>Rename</i>	Permits direct renaming of the selected element.
<i>Insert in diagram</i>	Inserts the selected model element into the momentarily active diagram .

## 3.4 Modeling Space

In the modeling space diagrams (see chapter 4.1) that typically display a prominent detail from the model can be represented in their own (internal) windows.

### 3.4.1 Tool Bar

The tool bar is dynamically adjusted to the currently selected diagram (see chapter 4.1), i.e. the tools that are admissible for the corresponding diagram type are automatically displayed and activated.

The following tools are supported by the UML-editor :

-  *Enlarges* the current diagram.
-  *Reduces* the current diagram.
-  Permits the *selection* of a model element.
-  Permits inserting of a *note*.
-  Permits *connecting a note* with another model element(node).
-  Permits inserting of a *package*.
-  Permits inserting of a *class* .
-  Permits *connecting* two classes by means of a relationship.
-  Permits the creation of a *reflexive relationship* of a class.
-  Permits the *inheritance (generalization)* between two model elements.
-  Permits the creation of a *dependency* between two model elements.

## 3.5 Documentation Space

The documentation view displays descriptions concerning an model element , e.g. by means of selection:

- in the navigation pane(see chapter 3.3)
- in the current diagram

A popup menu permits all common editing operations (see chapter 3.1.2).

## 3.6 Log Pane

The log pane see fig. 3.8 features run-time messages (e.g. when saving the model or during model check (see chapter 3.1.7)). Depending on the selection the following functions of the popup menu are possible:

Figure 3.8: log pane Select node (according to identification number)

FUNCTION	DESCRIPTION
<i>Delete</i>	Deletes the entire display in the log pane.
<i>Copy</i>	Inserts the selected messages in the copy buffer of the system.
<i>Select all</i>	Selects all messages.
<i>Make up lines</i>	Messages that are longer than the current window width are made up into two lines by the UML-editor .
<i>Save as. . .</i>	Permits the saving of all messages in the log pane of a file.
<i>Select node</i>	Applies only to special messages with identification number. This function selects the model element concerned by this message in the navigation pane.

## 3.7 Status Bar

The status bar is set up in three sections:

- *Left box* indicates which tool from the tool bar is currently activated.
- *Middle box* (At present this function is not implemented.)
- *Right box* (At present this function is not implemented.)

# Chapter 4

## Modeling Elements

Hereafter we describe model elements that can be modeled by means of the UML-editor . Based upon the language definition and resulting rules of INTERLIS there is a valid selection of sub-elements for each model element , These will be automatically supported by the UML-editor .

This is the particular strong point of the UML-editor, a user need not worry whether he is developping a valid model or not. Whatever is rendered possible by the editor, is also valid within the scope of UML and INTERLIS . Special cases can always be verified by means of the INTERLIS-compiler (see chapter [3.1.7](#)).

### 4.1 Class Diagram

The class diagrams strictly respect the rules of UML (see chapter [B](#)). All possible tools are automatically activated when opening a class diagram in the *tool bar* (see chapter [3.4.1](#)).

A typical use of class diagrams is the representation of packages see [fig. 4.1](#) or classes see [fig. 4.2](#):

#### 4.1.1 Popup-Menu for the Diagram

The following functions, affecting the entire diagram , are at your disposal:

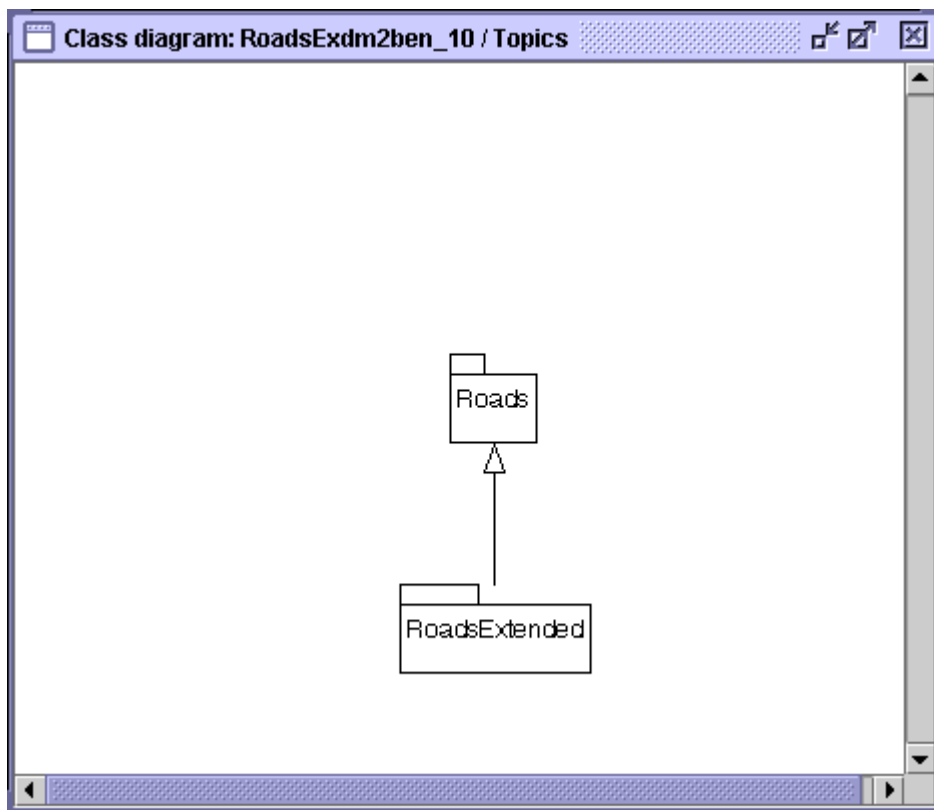

Figure 4.1: Class diagram – Representation of packages

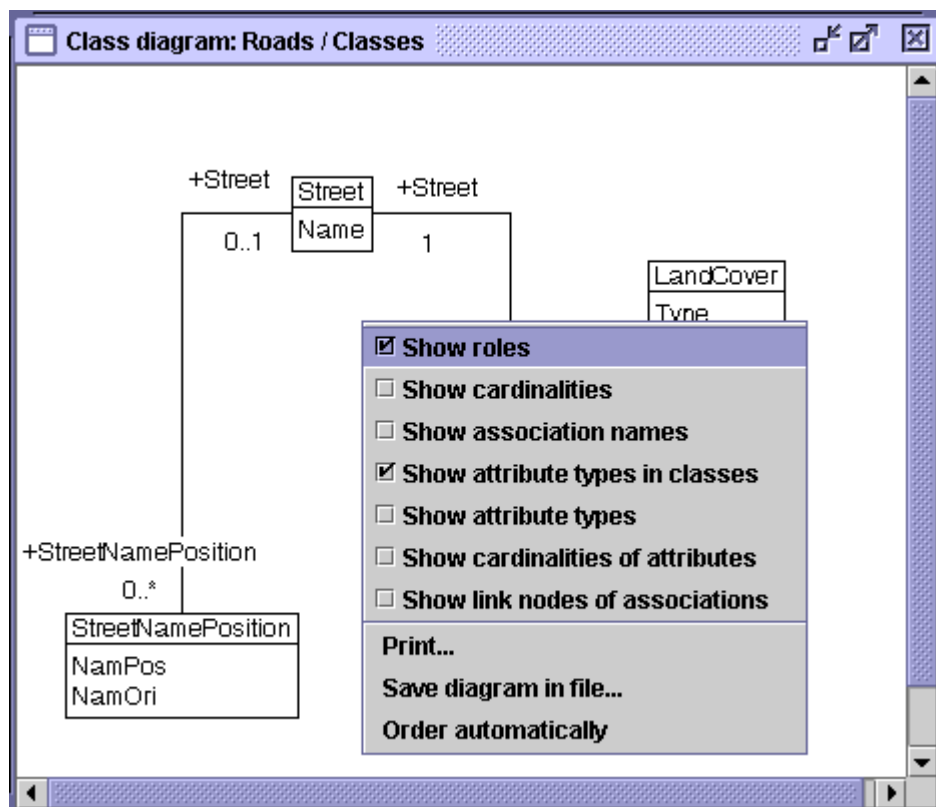

Figure 4.2: Class diagram – Representation of classes with popup-menu for the diagram

FUNCTION	DESCRIPTION
<i>Display role</i>	Represents the roles (see chapter 4.2.11) of a relationship or not. Roles are represented with a preceding plus (e.g. <i>+Street</i> see fig. 3.1).
<i>Display cardinality</i>	Represents the cardinalities of relationships or not (e.g. <i>0..*</i> see fig. 3.1).
<i>Display association names</i>	Represents the names of all relationships in the diagram or not.
<i>Display attributes in classes</i>	Represents the attributes of all classes in the diagram or not.
<i>Display type of attribute</i>	Represents the data type for all attributes displayed in all classes in the diagram or not.
<i>Display cardinality of attributes</i>	Represents the cardinality of all attributes displayed in all classes in the diagram or not .
<i>Display link node of associations</i>	The link node is an “artificial device”, that enables graphic links between particular cases of relationships (see chapter 4.2.9) in the diagram .
<i>Print...</i>	Opens a print dialog for the printing of the diagram.
<i>Save... in diagram file</i>	Opens a file-dialog for the saving of the diagram.
<i>Automatic reorganization</i>	Automatic reorganization of the contents of a diagram.

## 4.1.2 Popup-Menu of a Model Element

### General Functions

For each model element the following *general functions* are available see fig. 4.3:

FUNCTION	DESCRIPTION
<i>Modify...</i>	Opens the specification dialog (see chapter 4.2) for a model element.
<i>Selecting in the navigation pane</i>	Indicates the selected graphic object in the navigation pane.

Sub-menu *Formatting*:

FUNCTION	DESCRIPTION
<i>Font type...</i>	(At present this function is not implemented.).
<i>Line color...</i>	Opens a color dialog for the selection of a line color (e.g. for the coloring of associations).
<i>Fill-in color...</i>	Opens a color dialog for the selection of a fill-in color (e.g. for the coloring of class symbols).

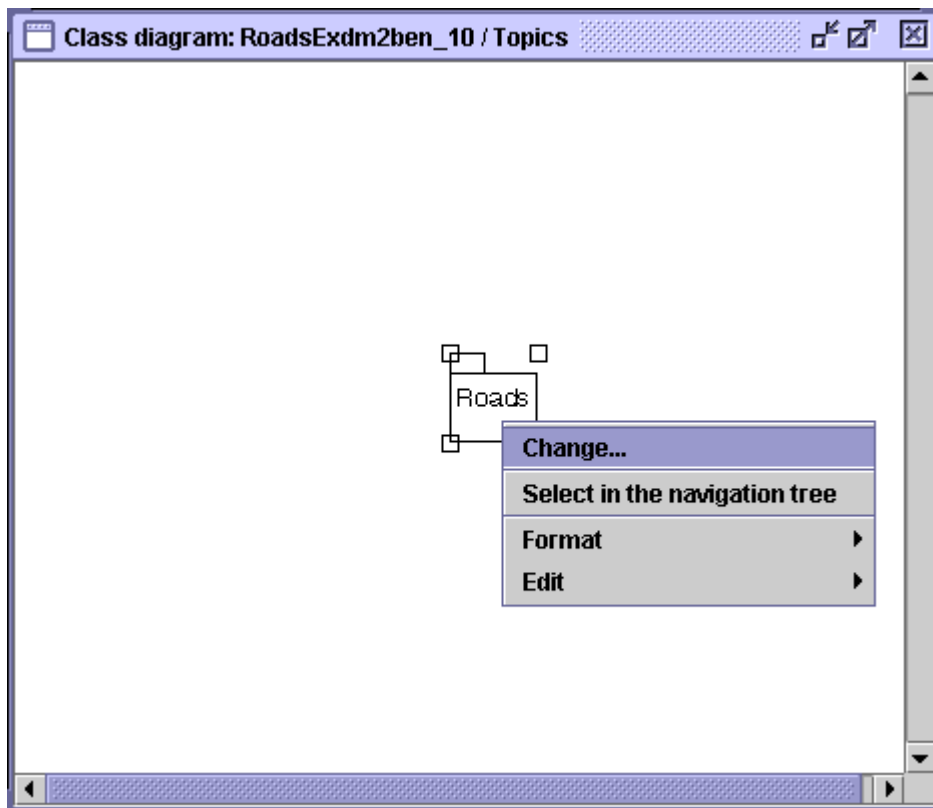

Figure 4.3: Class diagram – General remarks about popup-menu model elements

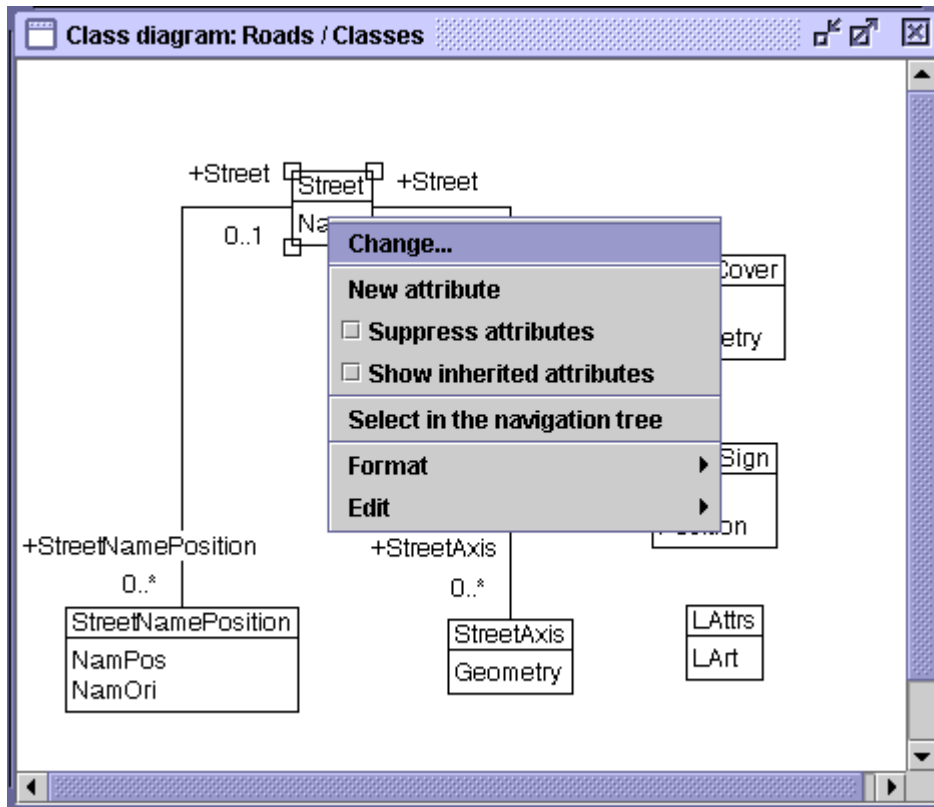

Figure 4.4: Class diagram – Special functions of a class

Sub-menu *Editing*:

FUNCTION	DESCRIPTION
<i>Cut</i>	(At present this function is not implemented.).
<i>Copy</i>	(At present this function is not implemented.).
<i>Paste</i>	(At present this function is not implemented.).
<i>Delete</i>	The selected model element is only graphically deleted in the current diagram, i.e. it remains in the navigation pane (and thus in the model).
<i>Delete in the model</i>	The selected model element is deleted graphically in the current diagram as well as definitively in the model. In addition all model dependencies are deleted (e.g. Roles in classes with connected associations).

### Class-specific functions

see fig. 4.4

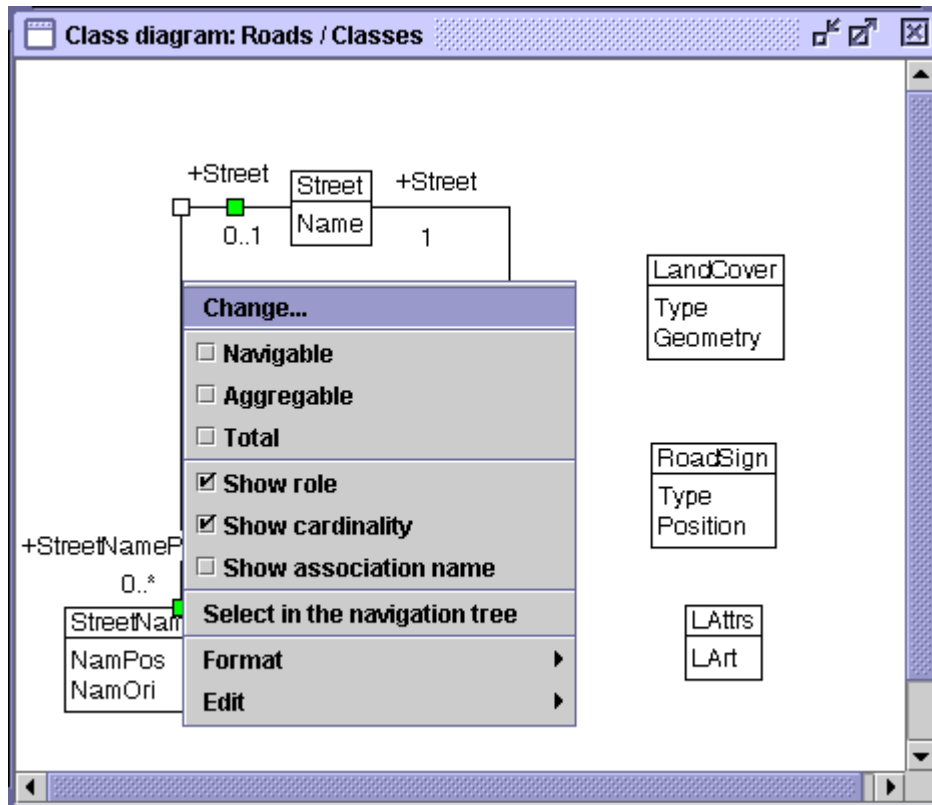

Figure 4.5: Class diagram – Special functions of an relationship

FUNCTION	DESCRIPTION
<i>New attribute</i>	Adds a new attribute (see chapter 4.2.10) to the class.
<i>Hide attributes</i>	Activates/ Deactivates representation of attributes for this class.
<i>Display inherited attributes</i>	In addition to the attributes defined in this class, the attributes of the basic class(es) are also displayed.

## Relation-specific functions

see fig. 4.5

Figure 4.6: dialog (tag *description*)

FUNCTION	DESCRIPTION
<i>Association</i>	Defines the <i>direction of navigation</i> towards a role (see chapter 4.2.11) on the corresponding relationship. In accordance with UML this is represented optically by an open arrow in the class diagram .
<i>Aggregation</i>	Characterizes the role (see chapter 4.2.11) of an relationship as <i>aggregation</i> . In accordance with UML this is represented optically with a void rhombus in the class diagram .
<i>Composition</i>	Characterizes the role (see chapter 4.2.11) of an relationship as <i>composition</i> . In accordance with UML this is represented optically with a filled in rhombus in the class diagram .
<i>Display role</i>	Activates / Deactivates the role name (see chapter 4.2.11) of a relationship (see chapter 4.1.1).
<i>Display cardinality</i>	Represents the <i>cardinality</i> of the roles (see chapter 4.2.11) of an relationship or not .
<i>Display name of association</i>	Represents the name of an relationship or not.

## 4.2 Dialogs

On principle there is a specific dialog for each model element to view or modify the properties of this element. Each model element-dialog features a minimum of the following tabs see fig. 4.6:

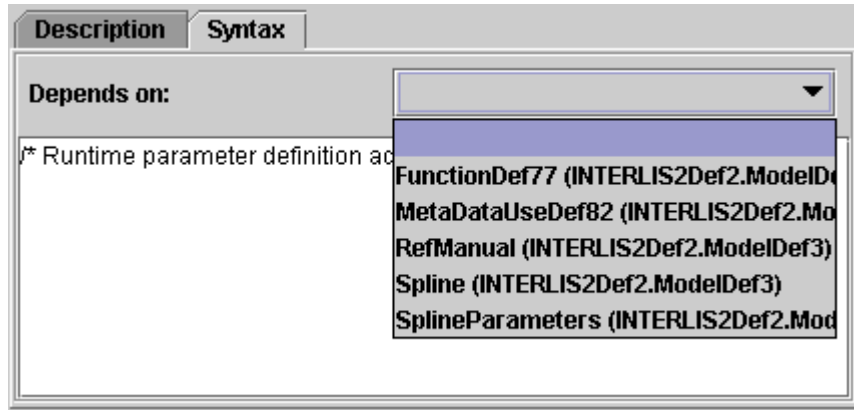

Figure 4.7: dialog (tag *Syntax*)

FIELD	DESCRIPTION
<i>Description</i>	Text entry with popup-menu featuring common text functions (see chapter 3.1.2). This text is taken into consideration when generating an object catalog

see fig. 4.7

FIELD	DESCRIPTION
<i>Depends of</i>	Possible dependencies of other <i>Model elements</i> can be selected from a list.
<i>INTERLIS Syntax</i>	Text entry with popup-menu featuring common text functions (see chapter 3.1.2). Permits entry of syntax code (in accordance with INTERLISrules). This code can be verified by means of the function <i>Model check</i> (see chapter 3.1.7).

Each dialog features the following functions:

FUNCTION	DESCRIPTION
<i>OK</i>	Saves all modifications and closes dialog.
<i>Cancel</i>	Rejects all modifications and closes dialog.
<i>Accept</i>	Saves all modifications without closing dialog.

## 4.2.1 Baskets of Reference Systems/Signatures

see fig. 4.8

FIELD	DESCRIPTION
<i>File name</i>	Assigns an XML-file .
<i>Description</i>	(see fig. 4.6).

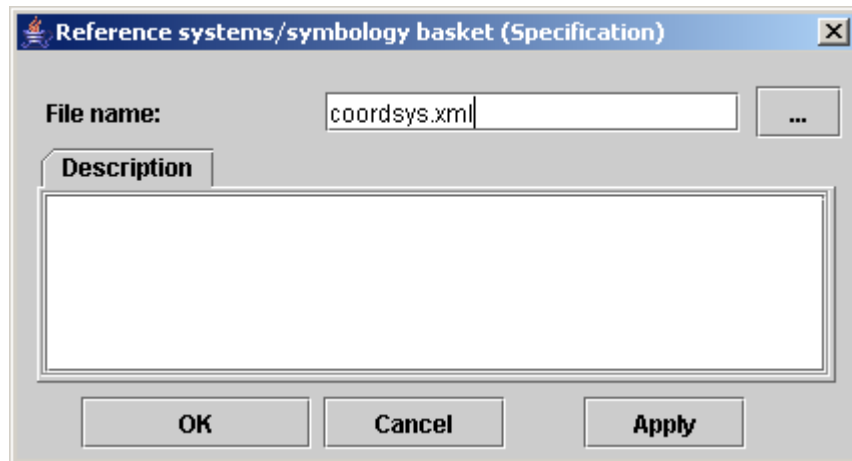

Figure 4.8: dialog – Containers of reference systems/signatures

## 4.2.2 UML-Package

A UML-package see fig. 4.9 corresponds to a folder, in which other elements can be stored. A UML-package is a model element which does not exist in INTERLIS and hence does not appear in the exported INTERLIS-model.

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>UML-package</i>
<i>Description</i>	(see fig. 4.6).

## 4.2.3 INTERLIS 2-File

A *INTERLIS 2-file* see fig. 4.10 corresponds to a package in accordance with UML.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.3.

FIELD	DESCRIPTION
<i>Table</i>	Lists language and corresponding file names. A model element <i>INTERLIS 2-file</i> represents an INTERLIS-model file (see chapter D.4). If the field file name is a relative file path, then it refers to a directory, in which the UML-editor file is stored. By means of the popup-menu-function <i>Modify...</i> a table entry can be modified.
<i>Linguistic version</i>	We refer to the version of the INTERLIS-specification applied. This version of the editor supports version 2.2.
<i>Description</i>	(see fig. 4.6).

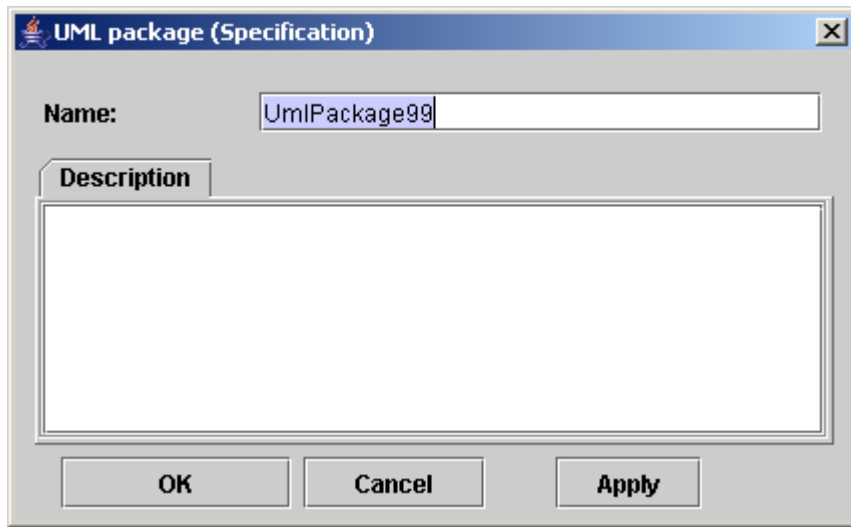

Figure 4.9: dialog – UML-Paket

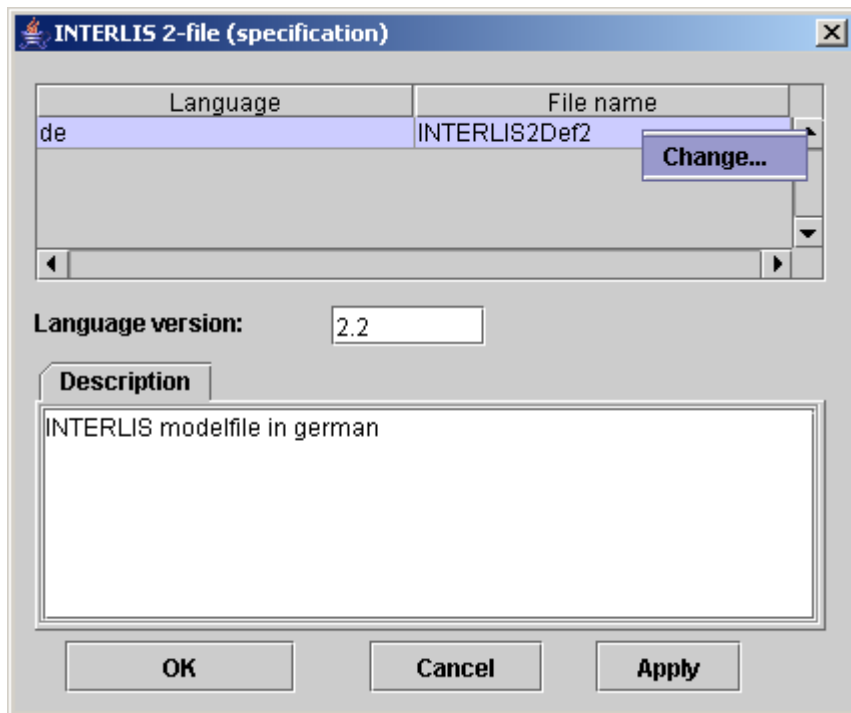

Figure 4.10: dialog – *INTERLIS 2-file*

Figure 4.11: dialog – *Model* (tag *Detail*)

#### 4.2.4 Model

A *model* see fig. 4.11 corresponds to a package) in accordance with UML.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.5.1.

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>model</i>
<i>Type</i>	Characterization (possible options being <i>types</i> , <i>reference systems</i> , <i>symbolologies</i> or <i>unlimited</i> ).
<i>Description</i>	(see fig. 4.6).
<i>Original language</i>	Initial language of the <i>Model</i> .
<i>Translation (table)</i>	A translation dialog can be opened via a popup-menu (see chapter 4.2.5). All translations concerning the <i>Model</i> are listed in the table.

see fig. 4.12

FIELD	DESCRIPTION
<i>Contract (Table)</i>	Via popup-menu you can open a contract dialog (see chapter 4.2.6). In this table all <i>authors</i> of contracts are listed.

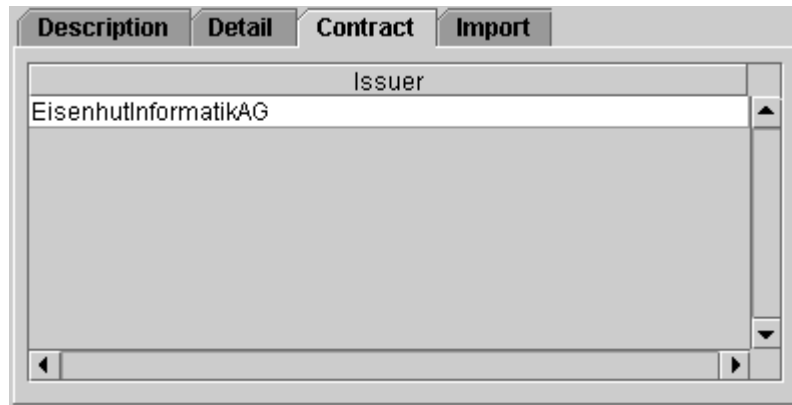

Figure 4.12: dialog – *Model* (tag *Contract*)

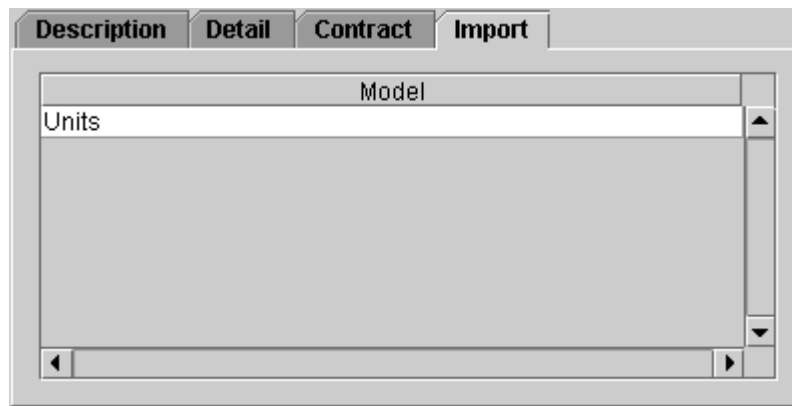

Figure 4.13: dialog – *Model* (tag *Import*)

see fig. 4.13

FIELD	DESCRIPTION
<i>Import (Tabelle)</i>	Via popup-menu and by means of a assignation dialog other <i>models</i> can be assigned and administered. In the table all imported <i>models</i> are listed. Import relationships can be represented in a package diagram.

## 4.2.5 Translation of the Model

At present multilingual models are not supported by the UML-editor .

For further information concerning rules and properties see INTERLIS 2 – Referencemanual

Figure 4.14: dialog – Translation of model

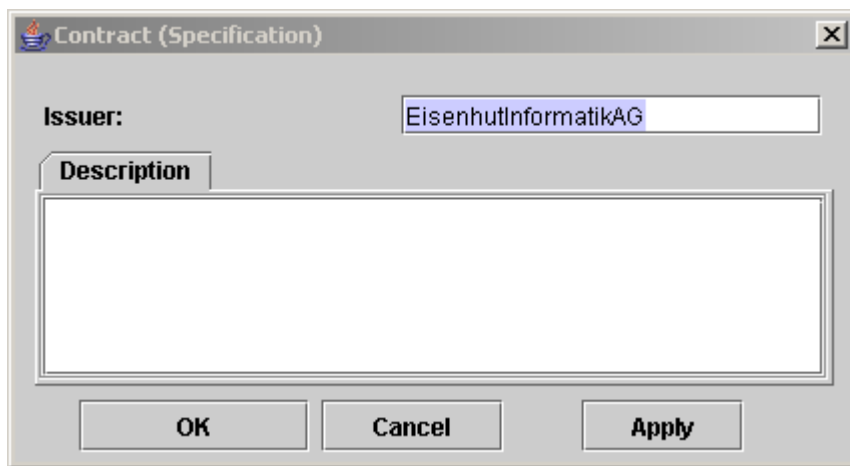

Figure 4.15: dialog – Contract

2.5.1. see fig. 4.14

FIELD	DESCRIPTION
<i>Language</i>	Target language of the translation.
<i>Basic language</i>	Initial language before the translation.

## 4.2.6 Contract

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 1.7. see fig. 4.15

FIELD	DESCRIPTION
<i>Editor</i>	Author of a contract.
<i>Description</i>	(see fig. 4.6).

Figure 4.16: dialog – *Topic* (tag *Detail*)

## 4.2.7 Topic

A *topic* see fig. 4.16 corresponds to a package in accordance with UML.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.5.2.

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>topic</i>
<i>Type</i>	Characterization (by <i>views</i> or <i>unlimited</i> ).
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>Extends</i>	Permits the selection of model element possibly to be extended from a list of model elements suitable for specialization (list is automatically generated by the UML-editor).

see fig. 4.17

FIELD	DESCRIPTION
<i>Dependency (Table)</i>	Via popup-menu and by means of an assignation dialog other <i>topics</i> can be assigned and processed. In the table all dependent <i>topics</i> are listed. The dependency relationships can be represented in a package diagram.

Figure 4.17: dialog – *Topic* (tag *Dependency*)

## 4.2.8 Class

A class see fig. 4.18 describes similar objects by means of attributes .

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.5.3.

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>class</i>
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>Extends</i>	Permits the selection of model element possibly to be extended from a list of model elements suitable for specialization (list is automatically generated by the UML-editor).
<i>Typ</i>	A class can either be characterized as a <i>class</i> (Default) or as a <i>structure</i> .

see fig. 4.19

FIELD	DESCRIPTION
<i>Attribute (Tabelle)</i>	Via popup-menu a list of <i>attributes</i> (see chapter 4.2.10) can be processed. All defined <i>attributes</i> are listed in the table.

see fig. 4.20

FIELD	DESCRIPTION
<i>Parameters</i>	Several <i>Parameters</i> in the form of syntax codes can be indicated (see fig. 4.7) . Use the symbol bar below the syntax field to facilitate when browsing, for input and deleting of <i>Parameters</i> .

see fig. 4.21

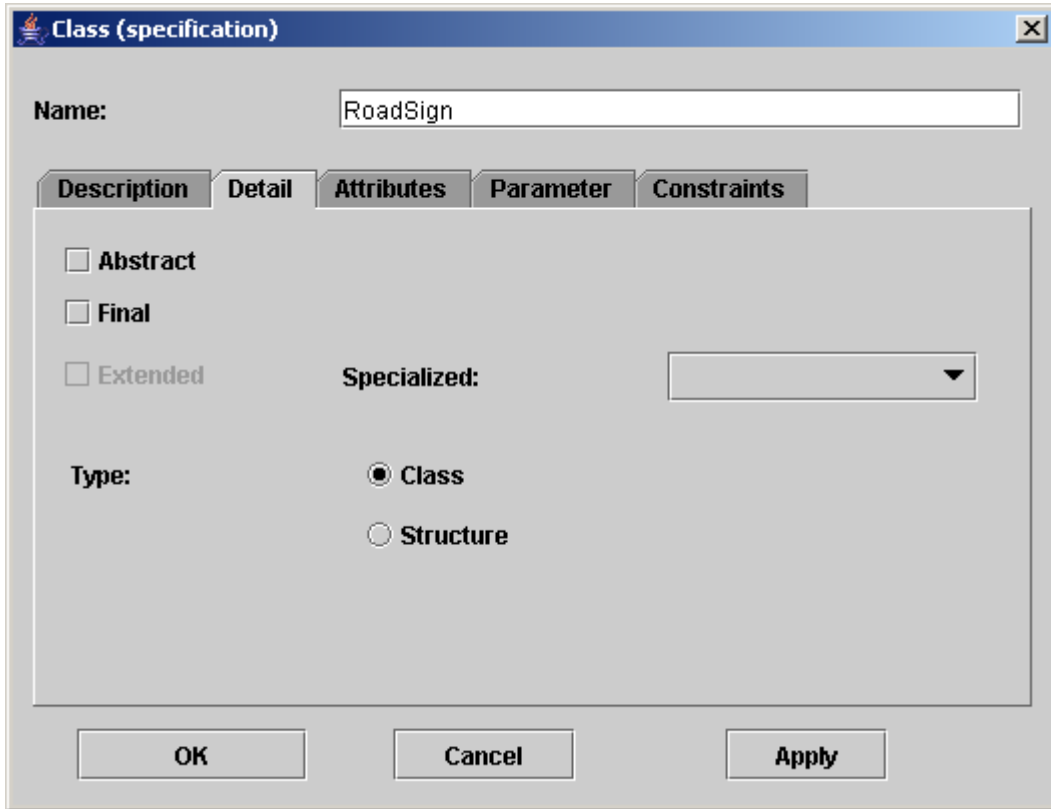

Figure 4.18: dialog – *Class* (tag *Detail*)

Figure 4.19: dialog – *Class* (tag *Attribute*)

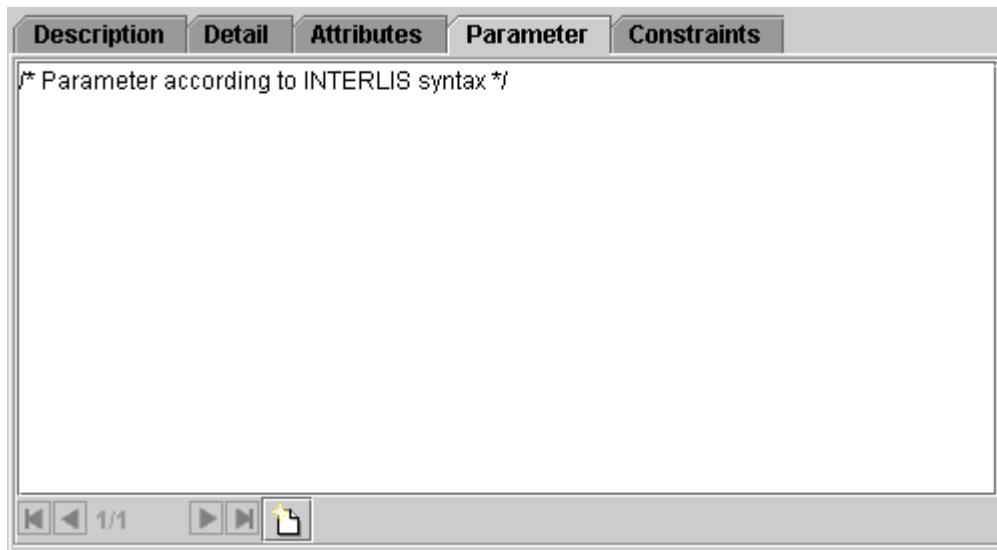

Figure 4.20: dialog – class (tag *Parameter*)

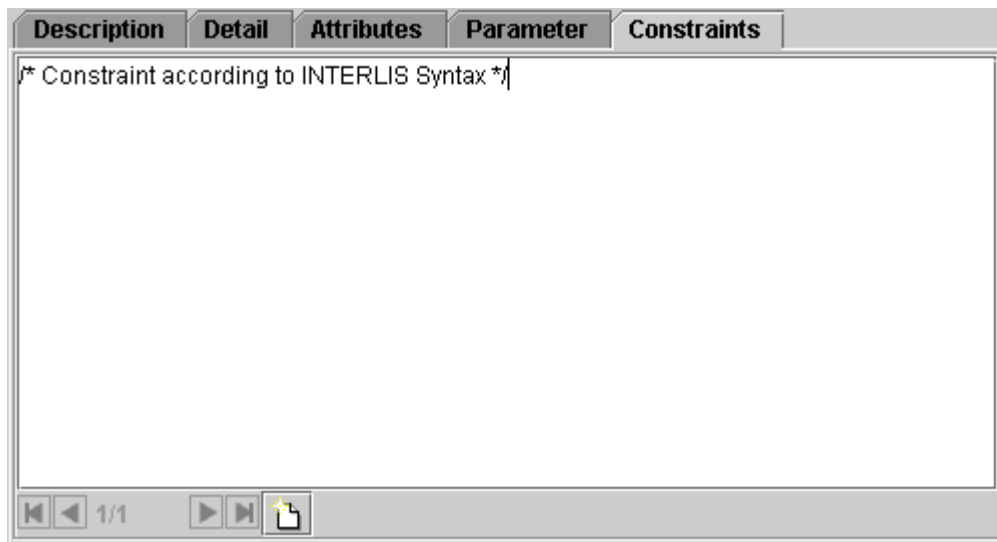

Figure 4.21: dialog – class (tag *Constraints*)

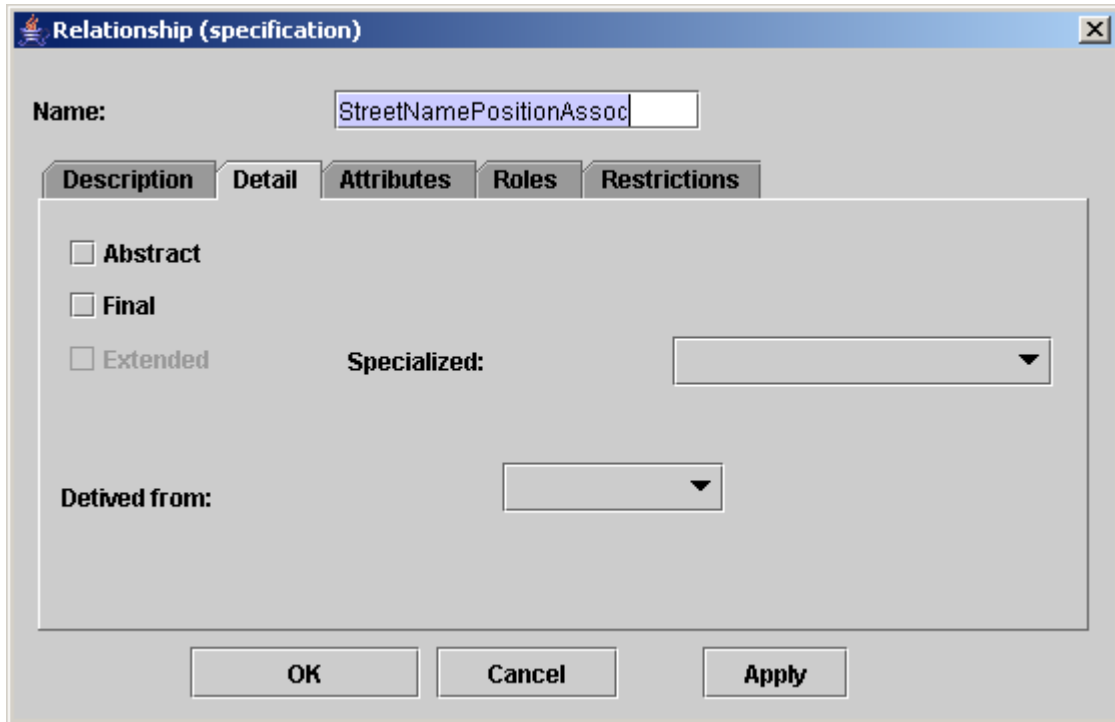

Figure 4.22: dialog – relationship (tag *Detail*)

FIELD	DESCRIPTION
<i>Constraints</i>	Several <i>Constraints</i> in the form of syntax codes can be indicated (see fig. 4.7) . Use the symbol bar below the syntax field to facilitate when browsing, for input and deleting of Constraints.

## 4.2.9 Relationship

An relationship see fig. 4.22 describes similar connections between individual objects.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.7.

Figure 4.23: dialog – relationship (tag *Attributes*)

Figure 4.24: dialog – relationship (tag *Roles*)

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>association</i>
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>Extends</i>	Permits the selection of model element possibly to be extended from a list of model elements suitable for specialization (list is automatically generated by the UML-editor).
<i>Derived from</i>	From a list an model element (in general a view) can be selected, from which the relationship is to be derived.

see fig. 4.23

FIELD	DESCRIPTION
<i>Attributes (Table)</i>	Via popup-menu a list of <i>attributes</i> (see chapter 4.2.10) can be processed. In the table all defined <i>attributes</i> can be listed.

see fig. 4.24

FIELD	DESCRIPTION
<i>Roles (Table)</i>	Via the table all defined <i>rolles</i> are listed.

see fig. 4.25

Figure 4.25: dialog – relationship (tag *Constraints*)

FIELD	DESCRIPTION
<i>Constraints</i>	Several <i>Constraints</i> in the form of syntax codes can be indicated (see fig. 4.7) . Use the symbol bar below the syntax field to facilitate when browsing, for input and deleting of Constraints.

There are a few special cases of associations (besides the common binary association), which the UML-editor supports graphically and thus also in the model.

### Reflexive relations

see fig. 4.26

### Inherited associations

see fig. 4.27

Hint:

- For graphic modelling it is necessary to visualize first the *link knots* in the class diagram (void rhombus in the middle of the association) (see chapter 4.1).

### Multiple relations

see fig. 4.28

Hint:

Figure 4.26: Reflexive relations

Figure 4.27: Inherited relations

Figure 4.28: Multiple relations

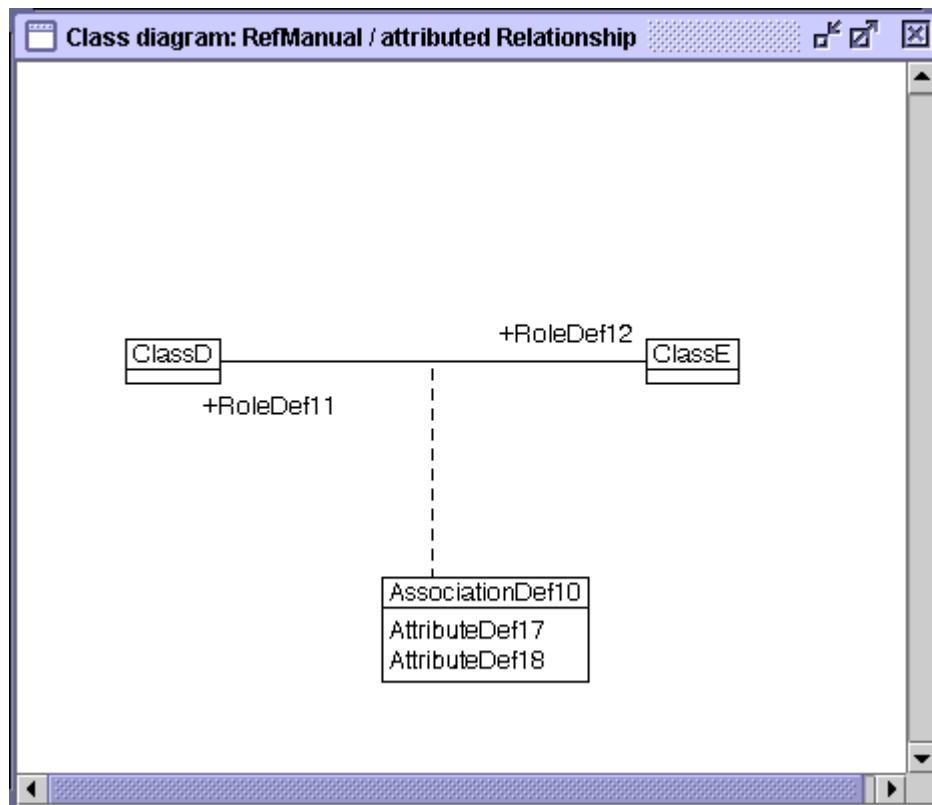

Figure 4.29: Association with attributes

- For graphic modelling it is necessary to visualize first the *link knots* in the class diagram (void rhombus in the middle of the association) (see chapter 4.1).

### Association with attributes

see fig. 4.29

Hint:

- Via the specification dialog *Attributes* can be processed in the tab *Attribute* . The representation in the class diagram ensues automatically.

#### 4.2.10 Attributes

An attribute (engl. feature or also property) see fig. 4.30 is a data element of a class. An attribute possesses both name and data type. As data types all types that have been defined by INTERLIS are at your disposal.

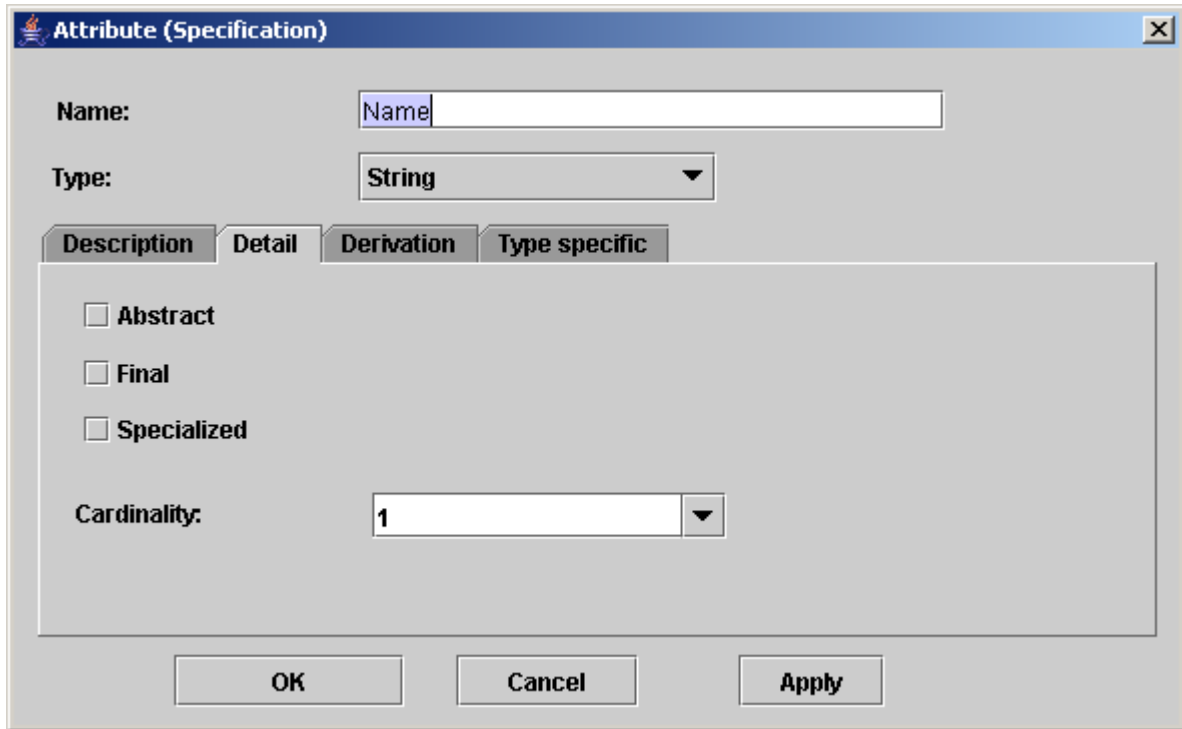

Figure 4.30: dialog – Attribute (tag *Detail*)

Attributes can be processed in three different ways, these being navigation pane (see chapter 3.3), class diagram see chapter 4.1.2 or this dialog.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.6.

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>Attributes</i>
<i>Typ</i>	Depending on the <i>type</i> selected specific information can be indicated in the tab (see below).
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>specialized</i>	Defines a model element as <i>specialized</i> or not.
<i>Cardinality</i>	Selection of the cardinality is possible in a list. Attributes with an anonymous domain can only possess cardinality 0..1 or 1. Attributes which refer to a domain definition, can have maximum cardinality greater than 1.

see fig. 4.31

Figure 4.31: dialog – Attribute (tag *Derivation*)

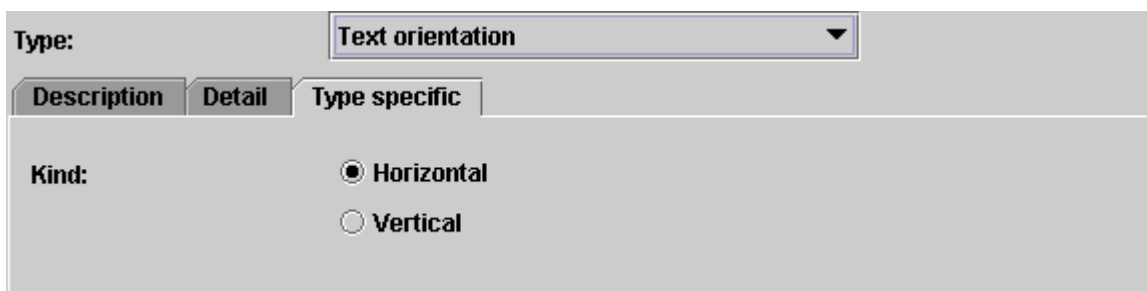

Figure 4.32: INTERLIS-basic type – Text orientation

FIELD	DESCRIPTION
<i>Derivation</i>	Permits the indication of a syntax code (see fig. 4.7) , e.g. a function call or a constant.

Depending on the *type* the representation of information in the tab varies:

## Boolean

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.4.

For the type *Boolean* there is no special view.

## Text Orientation

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.3. see fig. 4.32

FIELD	DESCRIPTION
<i>Type</i>	Characterizes the text orientation <i>Horizontal</i> or <i>Vertical</i> .

The screenshot shows a configuration window for the 'String' type. At the top, a dropdown menu is set to 'String'. Below it are four tabs: 'Description', 'Detail', 'Derivation', and 'Type specific', with 'Type specific' being the active tab. Under the 'Type specific' tab, there is a 'Kind:' label followed by four radio button options: 'Undefined', 'String' (which is selected), 'INTERLIS name', and 'Uniform Resource Identifier (URI)'. To the right of the 'String' radio button is a 'Max. length:' label and a text input field containing the number '20'.

Figure 4.33: INTERLIS-basic type – String

## String

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.1. see fig. 4.33

FIELD	DESCRIPTION
<i>Type</i>	Characterizes the string as <i>Undefined</i> , <i>String</i> (Default), <i>INTERLIS-name</i> or <i>Uniform Resource Identifier (URI)</i> .
<i>Max. Length (only for the selection of "string")</i>	entry of a whole number for limiting the maximum string length.

## Enumeration

With the type *enumeration* see fig. 4.34 it is possible to define enumerations or sub-enumerations as a tree-structure in the field *elements*. Furthermore each enumeration element can be commented upon in the domain *element description*.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.2.

FIELD	DESCRIPTION
<i>Type</i>	Charakterizes the string as <i>Undefined</i> (Default), <i>Ordered</i> , oder <i>Circular</i> .
<i>Elements</i>	A popup-menu permits the processing of enumerations in a tree structure (by means of sub-enumeration).
<i>Element description</i>	for each enumeration elementa corresponding comment can be formulated (see fig. 4.6).

Type: Enumeration

Description Detail Derivation Type specific

Kind:  Undefined  
 Ordered  
 Circular

Elements: Element description:

<ul style="list-style-type: none"><li><input type="radio"/> +E red</li><li><input type="radio"/> +E green</li><li><input type="radio"/> +E blue</li></ul>

**Reference system:**

Figure 4.35: INTERLIS-basic type – Numeric

## Numeric

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.5. see fig. 4.35

FIELD	DESCRIPTION
<i>Domain</i>	Characterizes the numeric domain as an <i>Undefined domain</i> (Default), as a <i>Defined domain</i> (permits the entry of a minimal or maximal domain as a value with flowing comma, whereby accuracy can be defined via the selection list), or as a <i>structured number</i> .
<i>Cirkular</i>	Defines a model element as <i>Cirkular</i> or not.
<i>Unit</i>	A list permits the selection of a <i>unit</i> existing in the model (see chapter 4.2.14). This list is automatically generated by the UML-editor.
<i>Type</i>	Characterizes the type as <i>Undefined</i> (Default), as <i>clockwise</i> or as <i>anti-clockwise</i> .
<i>Reference system</i>	Permits the indication of syntax code (see fig. 4.7) .

## Coordinate

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.7. see fig. 4.36

FIELD	DESCRIPTION
<i>Dimensions</i>	Defines the number of dimensions of the <i>coordinate</i> .
<i>Circular</i>	Defines a model element as <i>Circular</i> or not.
<i>1/2/3D (Numeric)</i>	For each dimension it is possible to indicate a <i>numeric value</i> (see chapter 4.2.10) moeglich.
<i>Rotation</i>	Defines a model element as <i>Rotation</i> or not.
<i>Main axis</i>	Provided the <i>rotation</i> has been determined, the <i>main axis</i> can be defined.
<i>PI-main axis</i>	Provided the <i>rotation</i> has been determined, the <i>PI-main axis</i> can be defined.

## Basket

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.9. see fig. 4.37

FIELD	DESCRIPTION
<i>Type</i>	Characterizes the type as <i>Undefined</i> (Default), <i>Data basket</i> , <i>Sicht-Behaelter</i> , <i>Basis-Behaelter fuer Grafik</i> oder als <i>Grafik-Behaelter</i> .
<i>According to</i>	Permits the indication of a topic (see chapter 4.2.7). This list is automatically generated by the UML-editor.

Figure 4.37: INTERLIS-basic type – Basket

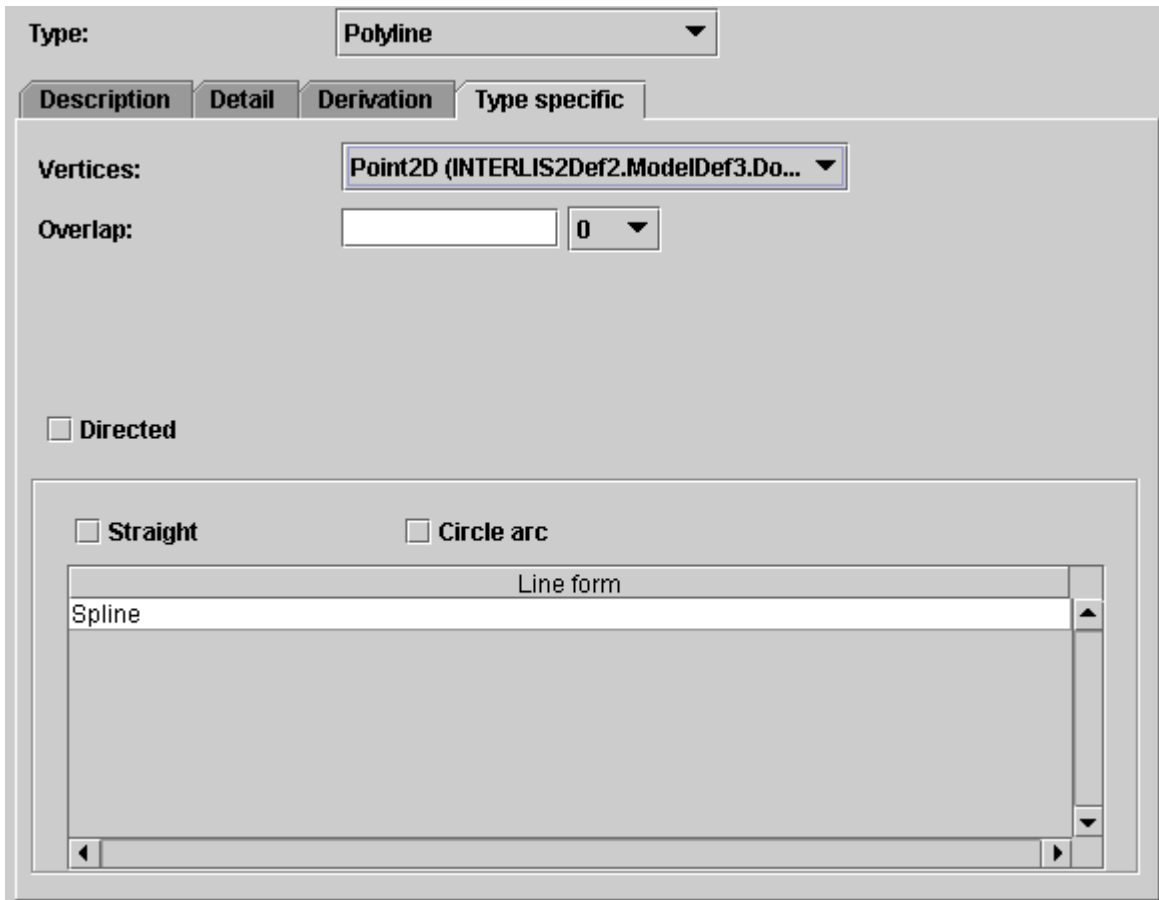

Figure 4.38: INTERLIS-basic type – Polyline

## Polyline

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.11.2. see fig. 4.38

FIELD	DESCRIPTION
<i>Vertices</i>	Permits the assignation of a domain (see chapter 4.2.12) for the vertices of a polyline. This list is automatically generated by the UML-editor.
<i>Overlap</i>	Permits the entry of a decimal value (definition of accuracy by means of selection list).
<i>Directed</i>	Defines the polyline as <i>directed</i> or not.
<i>Straight</i>	Defines <i>straights</i> as admissible line types.
<i>Circle arc</i>	Defines <i>circle arcs</i> as admissible line types.
<i>Line type (table)</i>	A popup-menu of the table permits the assignation of line types (see chapter 4.2.15).

Type: Surface

Description Detail Derivation **Type specific**

Vertices: Point2D (INTERLIS2Def2.ModelDef3.Do...)

Overlap: 0 0

Line attributes:

Straight  Circle arc

Line form

Figure 4.39: INTERLIS-basic type – Surface

## Surface

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.12.2. see fig. 4.39

FIELD	DESCRIPTION
<i>Vertices</i>	Permits the assignation of a domain (see chapter 4.2.12) for the vertices of the surfaces. This list is automatically generated by the UML-editor.
<i>Overlap</i>	Permits the entry of a decimal value (definition of accuracy by means of a selection list).
<i>Line attributes</i>	Permits the selection of a structure (see chapter 4.2.8) for the line attributes. This list is automatically generated by the UML-editor.
<i>Straight</i>	Defines <i>straights</i> as admissible line types.
<i>Circle arc</i>	Defines <i>circle arcs</i> as admissible line types.
<i>Line type (table)</i>	A popup-menu of the table permits the assignation of line types (see chapter 4.2.15).

## Area Tessellation

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.12.3. see fig. 4.40

FIELD	DESCRIPTION
<i>Vertices</i>	Permits the assignation of a domain (see chapter 4.2.12) for the vertices of the area tessellation. This list is automatically generated by the UML-editor.
<i>Overlap</i>	Permits the entry of a decimal value (Definition of accuracy by means of a selection list).
<i>Line attributes</i>	Permits the selection of a structure (see chapter 4.2.8) for the line attributes. This list is automatically generated by the UML-editor.
<i>Straights</i>	Defines <i>straights</i> as admissible line types.
<i>Circle arcs</i>	Defines <i>circle arcs</i> as admissible line types.
<i>Line type (table)</i>	A popup-menu of the table permits the assignation of line types (see chapter 4.2.15).

## Domain definition

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.6.2. see fig. 4.41

FIELD	DESCRIPTION
<i>Name</i>	Permits the assignation of the <i>domain</i> (see chapter 4.2.12). This list is automatically generated by the UML-editor.

Name:

Figure 4.41: INTERLIS-basic type – Domain definition

### 4.2.11 Role

A role see fig. 4.42 is on end of a relationship. When dealing with a relationship between the class *school* and the class *person*, *teacher* would be a possible role for a *Person*.

For further information concerning rules and properties see INTERLIS 2 – Referencemanual

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>role</i>
<i>Type</i>	Permits the indication if <i>Association</i> (Default), <i>Aggregation</i> or <i>Composition</i> ( For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.7.2.). Depending on the selection the specific representation (rhomboid) ensues in the class diagram in accordance with UML.
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>Specialised</i>	Defines a model element as <i>Specialised</i> or not.
<i>Ordered</i>	Defines a model element as <i>Ordered</i> or not.
<i>Navigierbar</i>	Defines a model element as <i>Navigierbar</i> or not.
<i>Cardinality</i>	( For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.7.3.)
<i>Classes concerned</i>	Permits the selection of the <i>class</i> concerned with this <i>Role</i> (see chapter 4.2.8). This list is automatically generated by the UML-editor.
<i>Constraints (Table)</i>	Permits the assignation of corresponding <i>classes</i> (see chapter 4.2.8 and For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.7.5.).
<i>Type of reference</i>	Permits the selection of the <i>Role</i> as <i>Association</i> (Default), <i>Structure</i> or <i>Reference</i> .

### 4.2.12 Domain

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8. see fig. 4.43

Figure 4.42: dialog – Role (tag *Detail*)

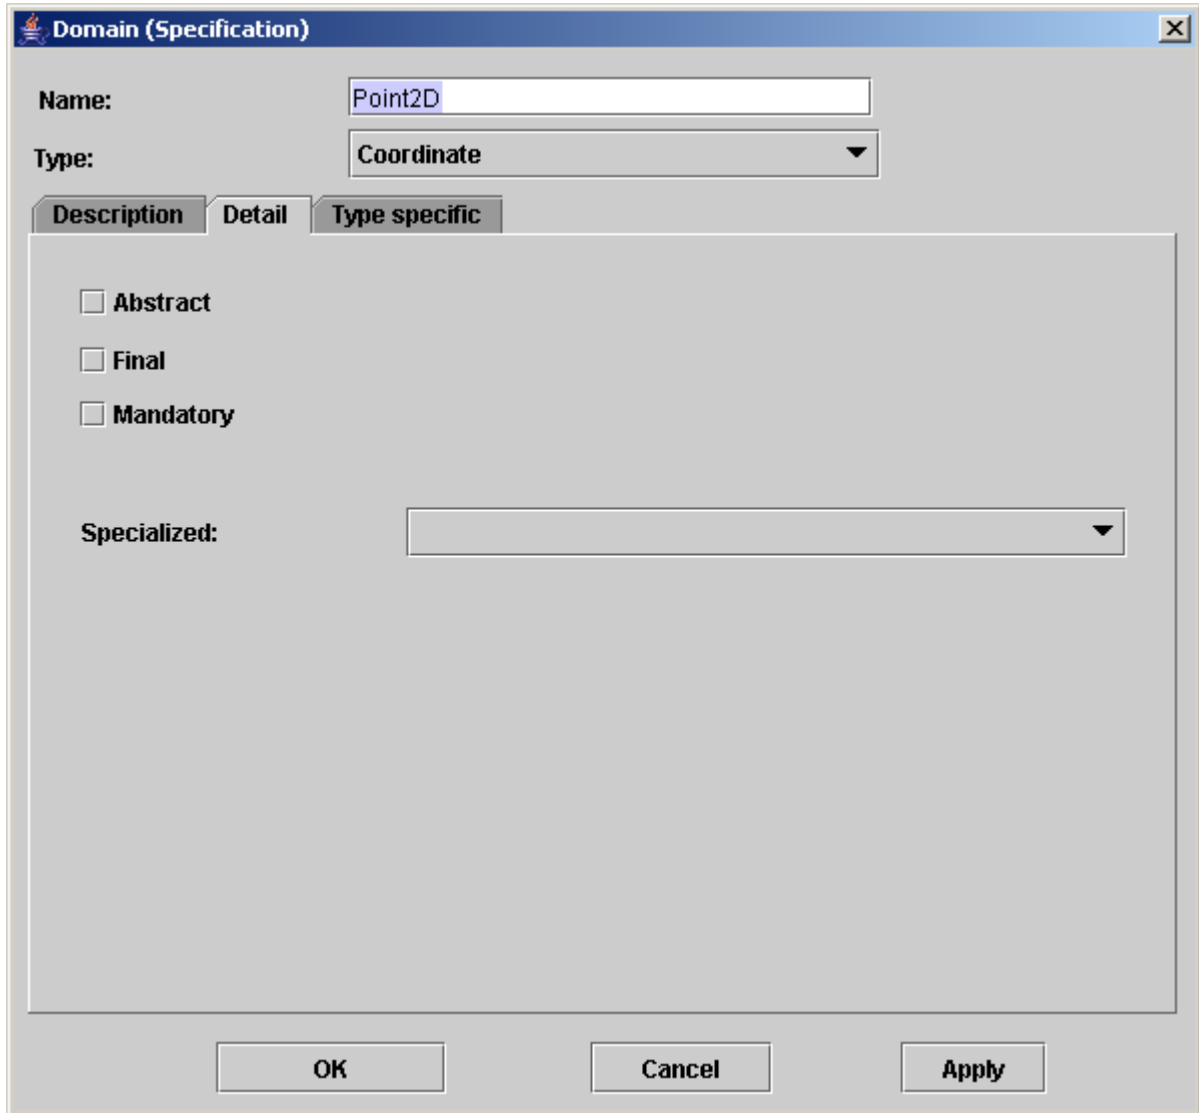

Figure 4.43: dialog – Domain

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>domain</i>
<i>Typ</i>	Depending on the <i>type</i> selected it is possible to indicate special information in a tab (analogous see chapter 4.2.10).
<i>Description</i>	(see fig. 4.6).
<i>abstract</i>	Defines a model element as <i>abstract</i> or not.
<i>final</i>	Defines a model element as <i>final</i> or not.
<i>Mandatory</i>	Defines a model element as <i>Mandatory</i> or not.
<i>Specialised</i>	Permits the selection of a basic <i>-domain</i> .

### 4.2.13 Reference Systems/Symbology Baskets - Agreement

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.10. see fig. 4.44

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>reference system/symbology basket - Agreement</i>
<i>Basket identification (BID)</i>	Indication of the BID.
<i>Type</i>	Selection as <i>symbology basket</i> (Default) or <i>reference system basket</i> .
<i>Description</i>	(see fig. 4.6).
<i>Definition</i>	(see fig. 4.7)

### 4.2.14 Unit

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.9. see fig. 4.45

FIELD	DESCRIPTION
<i>Name (Abbreviation)</i>	Abbreviation of the <i>Unit</i> .
<i>Description</i>	Name written in full of the <i>Unit</i> .
<i>Description</i>	(see fig. 4.6).
<i>Depends on</i>	Selection of dependency on another model element. This list is automatically generated by the UML-editor..
<i>Syntax</i>	(see fig. 4.7).

### 4.2.15 Line Form Type

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.8.11.3. see fig. 4.46

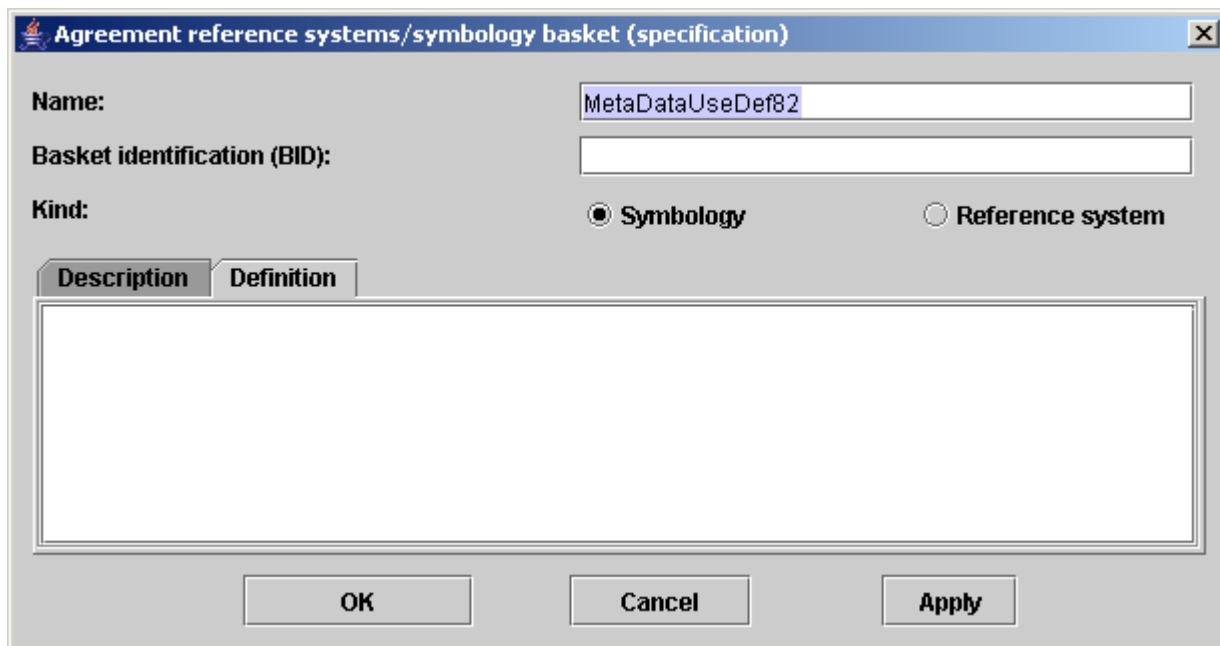

Figure 4.44: dialog – Reference systems/Symbology baskets

Figure 4.45: dialog – Unit

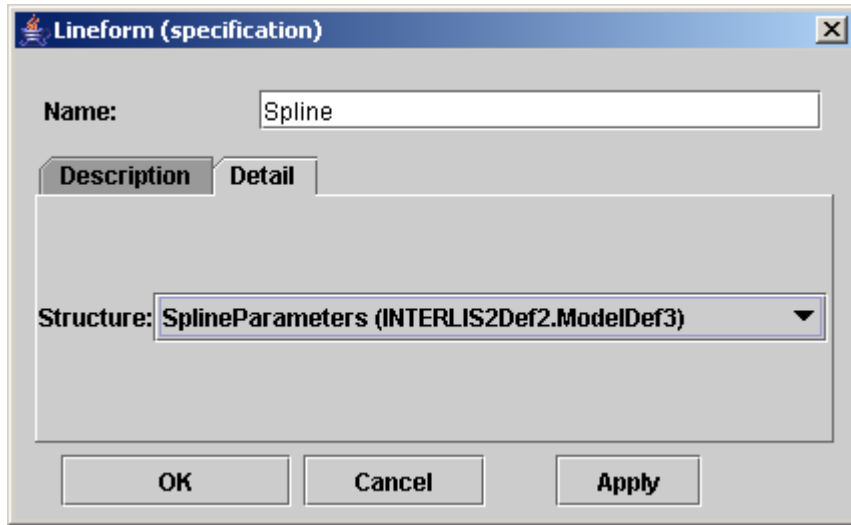

Figure 4.46: dialog – Line form

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>Line form</i>
<i>Description</i>	(see fig. 4.6).
<i>Syntax</i>	(see fig. 4.7).

#### 4.2.16 Run Time Parameter

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.11. see fig. 4.47

FIELD	DESCRIPTION
<i>Name</i>	Name of <i>Run time parameter</i>
<i>Description</i>	(see fig. 4.6).
<i>Syntax</i>	(see fig. 4.7).

#### 4.2.17 Function

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.14. see fig. 4.48

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>function</i>
<i>Description</i>	(see fig. 4.6).
<i>Syntax</i>	(see fig. 4.7).

Figure 4.47: dialog – Run time parameter

Figure 4.48: dialog – Function

Figure 4.49: dialog – View

#### 4.2.18 View

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.15. see fig. 4.49

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>view</i>
<i>Description</i>	(see fig. 4.6).
<i>Syntax</i>	(see fig. 4.7).

#### 4.2.19 Graphic

For further information concerning rules and properties see INTERLIS 2 – Referencemanual 2.16. see fig. 4.50

FIELD	DESCRIPTION
<i>Name</i>	Name of the <i>graphic</i>
<i>Description</i>	(see fig. 4.6).
<i>Syntax</i>	(see fig. 4.7).

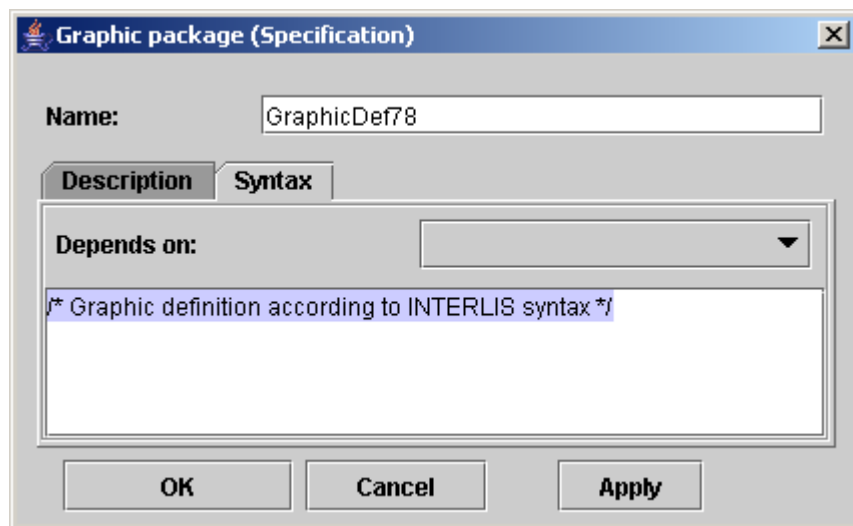

Figure 4.50: dialog – Graphic

# Appendix A

## Technical Background

The UML-editor is based entirely on the UML meta model of the Object Management Group (OMG). Thus it is guaranteed that all models created with this UML-editor will be compatible in all respects of the UML-specification (see chapter [B.1](#)). Any upgrade of the UML-meta model design on the part of OMG should be possible with very little effort.

An INTERLIS-Plugin extends and concretizes the UML-meta model by adding INTERLISelements. Thus the UML-editor becomes the ideal tool for users that intend to model INTERLIS (see chapter [C.1](#)) (i.e. geomatic engineers).

The UML-editor has been entirely conceived in Java (s. <http://java.sun.com>). Java was considered the ideal device for this project because besides other advantages it offers the possibility to implement the object-oriented design of UML and INTERLIS . Furthermore Java is deemed platform-independent. The present release is based upon JRE 1.3, but on principle it can also be applied in improved versions of the Virtual Machine (VM).

For its greater part the model has been designed with Rational Rose (a commercial UML-editor) and then generated with a specially extended Java-Code-Generator. Thus the design will always be up-to-date with the source code.

This document was drafted in L<sup>A</sup>T<sub>E</sub>X.

# Appendix B

## UML

OMG's Unified Modeling Language™(UML) is of use when specifying, visualizing and documenting models in connection with software systems (including their structure and design).

UML can be used in business-modeling as well as in non-software-systems. In the present case UML is especially adapted to the demands of modeling of INTERLIS-data models.

### B.1 Specification

The present version of the UML-editor is determined by the *UML Specification Version 1.4*.

It is possible to look into detailed information concerning the contents of the UML specification under <http://www.omg.org/uml> .

#### B.1.1 UML Meta Model

OMG makes the UML meta modell available in the form of a download .

The UML-specification in accordance with OMG is very extensive. In the present version of the UML-editor only those possibilities have been implemented with priority which are relevant within the scope of modeling with INTERLIS.

# Appendix C

## INTERLIS

### C.1 Specification

The present version of the UML-editor is in accordance with the *INTERLIS specification version 2*.

For more detailed information concerning this reference manual see <http://www.interlis.ch>

### C.2 INTERLIS Compiler

The INTERLIScompiler developed by *Eisenhut Informatik AG* (see chapter 2.4) on behalf of KOGIS (cf. <http://www.interlis.ch>) is an integrated component of the UML-editor and permits e.g. the examination of INTERLIS language definitions within an INTERLIS model (see chapter 3.1.7).

# Appendix D

## Formats

### D.1 UML-editor-Format

The UML-editor uses its own format for saving (see chapter 3.1.1) models with the ending *.uml*.

### D.2 XML-Schema

ASCII-Code nach *Export of an XML-Schema* (see chapter 3.1.7) into a file with suffix *.XSD*.

## D.3 INTERLIS-Compiler Configuration

Compiler configuration files use the format *\*.ilc* (see chapter 3.1.7).

## D.4 INTERLIS Model File

In general an INTERLIS-model file ends in *.ili* and contains ASCII-signs. When importing/exporting (see chapter 3.1.7) from an INTERLIS model INTERLIScode in an ASCII-file is expected as follows.

An example according to the Roads Model in see fig. 3.1):

```

\textbf{INTERLIS} 2.2;

\textbf{MODEL} ModelDef3 (de) =

    \textbf{DOMAIN}

        Point2D= \textbf{COORD NUMERIC CIRCULAR, NUMERIC};

\textbf{TOPIC TOPIC} Roads =

    \textbf{CLASS} StreetAxis =
        Geometry : \textbf{TEXT*}20;
    \textbf{END} StreetAxis;

```

```

\textbf{CLASS} LandCover =
  Type : \textbf{TEXT*}20;
  Geometry : \textbf{TEXT*}20;
\textbf{END} LandCover;

\textbf{CLASS} PointObject =
  Type : \textbf{TEXT*}20;
  Position : \textbf{TEXT*}20;
\textbf{END} PointObject;

/** Position of a StreetName
 */
\textbf{CLASS} StreetNamePosition =
  NamPos : \textbf{TEXT*}20;
  NamOri : \textbf{TEXT*}20;
\textbf{END} StreetNamePosition;

\textbf{UNIT}

  PI / 180 [rad]

\textbf{CLASS} Street =
  Name : \textbf{TEXT*}20;
\textbf{END} Street;

\textbf{ASSOCIATION} StreetNamePositionAssoc =
  StreetNamePosition -- {0..*} StreetNamePosition;
  Street -- {1} Street;
\textbf{END} StreetNamePositionAssoc;

\textbf{ASSOCIATION} StreetAxisAssoc =
  Street -- {1} Street;
  StreetAxis -- {9223372036854775807..*} StreetAxis;
\textbf{END} StreetAxisAssoc;

\textbf{END TOPIC} Roads;

\textbf{TOPIC TOPIC} RoadsExtended =

  \textbf{CLASS} PointObjectExtended
  \textbf{EXTENDS} ModelDef3.\textbf{TOPIC} Roads.PointObject =
  \textbf{END} PointObjectExtended;

  \textbf{CLASS} StreetAxisExtended
  \textbf{EXTENDS} ModelDef3.\textbf{TOPIC} Roads.StreetAxis =

```

```
Precision : \textbf{TEXT*}20;  
\textbf{END} StreetAxisExtended;  
  
\textbf{END TOPIC} RoadsExtended;  
  
\textbf{END} ModelDef3.
```

# Appendix E

## Country-Specific Differences

Depending on the country or region there are different names for the same technical term. All texts (strings) concerning the UML-editor are stored in so-called *ressource-files* (*with the ending .property*) . This bears the advantage, that the terms used in the UML-editor can be altered without having to recompile the entire program. This is why it may be possible that e.g. field names differ from the ones printed in this manual.

- [1] OMG, *Object Management Group*, <http://www.omg.org>, The Object Management Group (OMG) is an open membership, non-profit consortium that produces and maintains computer industry specifications for interoperable enterprise applications. Our membership includes virtually every large company in the computer industry, and hundreds of smaller ones. Most of the companies that shape enterprise and Internet computing today are represented on our Board of Directors.
